Medication/Order Updates

11.2 Changes and Enhancements
There are new filtering options in the Medication and Orders component. Here you can see a comparison between was available in the previous version and the Updated Version.

You can now see views for Current Medications, Past Medications, All Medications, and the Current Encounter. You can also group by Provider or Encounter.

Finally, a new drop-down provides the ability to sort alphabetically or by date.
Here, we see another comparison between previous and the new version. These screenshots show the level of detail that displays by default in each of the versions.

As you see, the expanded details are defaulted in the new version, which means you don’t have to click the plus (+) sign to see them.
